WIMS • PERSONAL CASE STUDY

June 2026 Fasting Report

Weight Management as Measurement and a Feedback System

A Reflective, Data-Led Personal Case Study

September 2025 – January 2026

Graham Heap

Speaker Notes

2 / 29

HEALTH WARNING

Personal Case Study

Not Medical Advice

Personal experience using fasting and gentle exercise to manage weight.

Personal data and reflection.

Not a formal scientific study.
Not medical advice.
Not general advice.

The presentation describes what happened and what was learnt.
It does not provide a recommendation for others to follow.

Speaker Notes

3 / 29

WHY THIS STUDY

Why Was This Study Undertaken?

- To observe what happened when fasting was used to manage weight.
- To record weight consistently.
- To look for patterns rather than rely on individual readings.
- To reflect on what the measurements might mean.

The starting point was observation, measurement and curiosity.

Speaker Notes

4 / 29

BACKGROUND

Weight Management Is Not Simply a Nutritional Problem

- Quality and quantity of food.
- Exercise.
- Quality of life.
- Personal reasons such as health and confidence.

Sustainable change tends to emerge through small, repeatable actions rather than willpower alone.

Speaker Notes

5 / 29

METHOD & CONSTRAINTS

How Was the Experiment Recorded?

- Weight recorded daily in a spreadsheet.
- Weekly averages calculated.
- Compared with weekly targets.
- Morning/rested weight used as the first measurement.
- Weekly trends considered more useful than individual fluctuations.
- Fasting varied between approximately 1 and 4 days per week.

Blood sugar, hormones, calorie intake, controlled exercise, sleep, stress and life events were not measured.

Speaker Notes

6 / 29

REFLECTION

What?

- Describe the event.
- What happened?
- What did you observe?
- What did you measure?

So What?

- What is the significance to you?
- What does the observation tell you?
- What have you learned?
- Why does it matter?

What Next?

- What action will you take?
- What might you change?
- What will you do differently?
- How will you measure the result?

Speaker Notes

7 / 29

SEPTEMBER 2025

Week	Fasting days	Average
01/09	4	16.51 st
08/09	3	16.22 st
15/09	4	15.90 st
22/09	3	15.59 st
29/09	2	16.04 st

Overall downward trend, with a rebound in Week 5.

Strong initial reduction with normal weekly variability.

Speaker Notes

8 / 29

OCTOBER 2025

Week	Fasting days	Average
06/10	1	15.84 st
13/10	2	15.55 st
20/10	3	15.26 st
27/10	4	14.97 st

Weight decreased steadily while fasting frequency increased.

Sustained downward trend with consistent measurement.

Speaker Notes

9 / 29

NOVEMBER 2025

Week	Fasting days	Average
03/11	1	15.25 st
10/11	2	15.14 st
17/11	3	14.96 st
24/11	4	14.78 st

Weight continued falling, but more slowly than September and October despite increasing fasting frequency.

Continued reduction approaching approximately 15 stone.

Speaker Notes

→ 10 / 29

DECEMBER 2025

The Experiment Paused For Christmas

The break provides a natural interruption in the observation period.

Speaker Notes

11 / 29

JANUARY 2026

Week	Fasting days	Average
05/01	3	15.26 st
12/01	3	15.18 st
19/01	3	15.00 st
26/01	0	15.50 st

Weight fell when fasting resumed and increased again when fasting stopped.

Overall stabilisation around 15.5 stone.

Speaker Notes

12 / 29

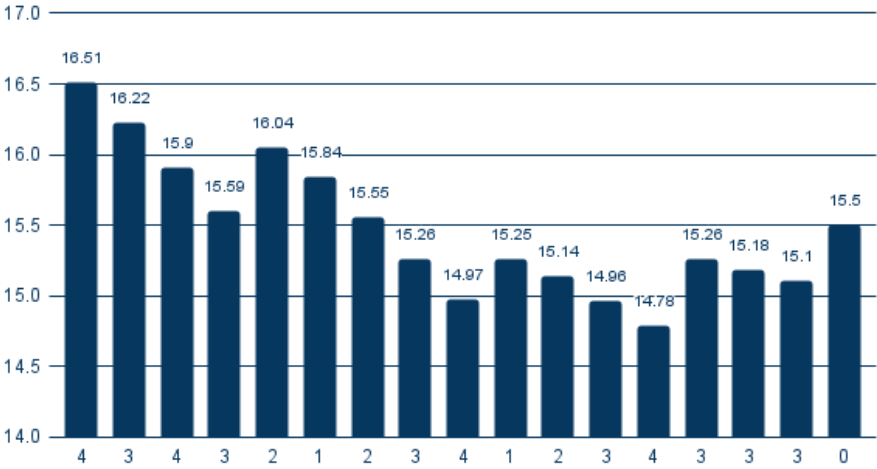

Week	Fasting days	Average
01/09	4	16.51 st
08/09	3	16.22 st
15/09	4	15.90 st
22/09	3	15.59 st
29/09	2	16.04 st
06/10	1	15.84 st
13/10	2	15.55 st
20/10	3	15.26 st
27/10	4	14.97 st
03/11	1	15.25 st
10/11	2	15.14 st
17/11	Speaker Notes	14.96 st

DATA SUMMARY

The Overall Picture

Average Weight Loss: September 2025 to January 2026

Speaker Notes

SO WHAT?

Analysis & Reflection

Measurement + feedback + fasting + gentle exercise appeared more important than fasting alone.

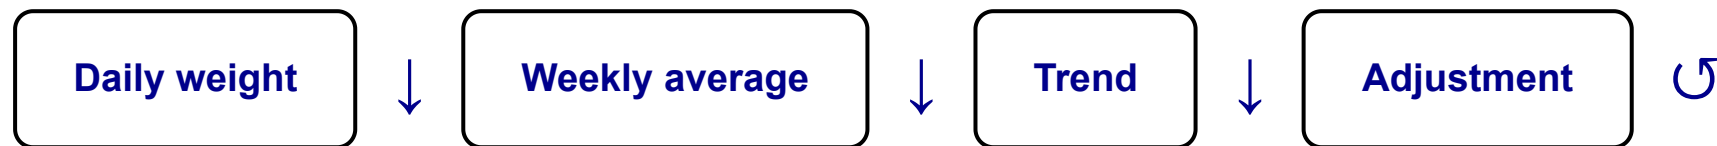

Speaker Notes

15 / 29

MEASUREMENT

Measurement as a Feedback System

The numbers become a signal rather than a series of individual successes or failures.

The weight-management problem begins to look more like a feedback system than a diet.

ADJUSTMENT

From Dieting to Adjustment

The aim is not perfection but small adjustments over time.

Speaker Notes

17 / 29

ACTIVITY

The Role of Activity During Fasting

Earlier, approximately two hours of low-intensity activity before breaking a fast appeared to have a noticeable effect.

Speaker Notes

18 / 29

BEHAVIOUR & BIOLOGY

Why Might Fasting Work?

BEHAVIOUR

- Fewer meals.
- Fewer decisions.
- Simple structure.
- Easier than constantly managing portions.

BIOLOGY

- Blood sugar falls.
- Glycogen stores reduce.
- Stored fat may increasingly be used.

The report's key observation: behaviour and biology appear to matter together.

Speaker Notes

19 / 29

POSSIBLE EXPLANATION

Why Fasting Is Considered to Work

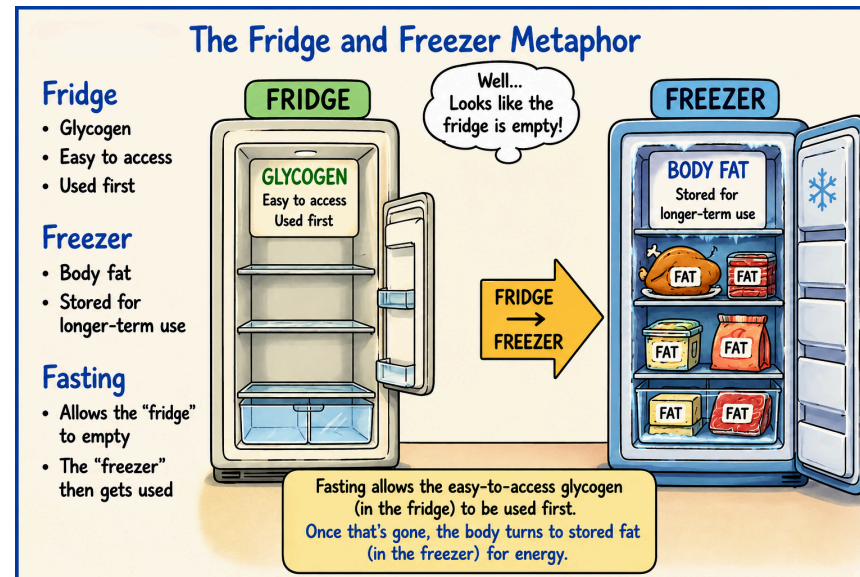

A practical explanation may be equally important: fasting reduced overall food intake and simplified decision-making.

Speaker Notes

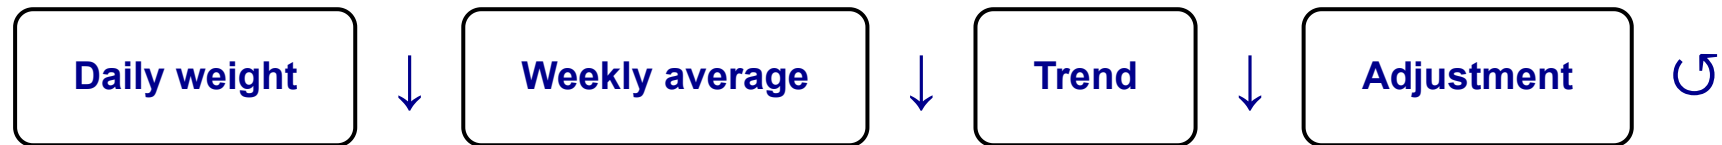

20 / 29

THE BIGGER IDEA

Fasting Is a Method

But Not the Whole Story

The driver observes the speed and makes small adjustments.

Measurement + feedback + willingness to adjust may matter more than one particular diet.

WHAT NEXT?

What Was Learnt?

- Regular measurement matters.
- Weekly trends matter more than daily fluctuations.
- Short repeated fasts were easier to sustain than prolonged restriction.
- Weight can be viewed as a feedback-control problem.

Speaker Notes

→ 23 / 29

What Is Significant?

- Weight reduced from approximately 16.5 stone to approximately 15 stone.
- Reduction occurred without calorie counting.
- Weight increased when measurement and fasting stopped.
- Measurement itself appeared to influence behaviour.

Speaker Notes

24 / 29

Questions Raised

- What is blood sugar?
- What is low blood sugar?
- What are simpler ways to deplete glycogen?
- How does weight fluctuate during fasting, eating and feasting?
- How do rested, full and fasted weight help understand potential weekly weight loss?
- Can these measurements forecast potential fasting-related weight loss?
- What is the best path of fasting?
- How could someone with no fasting experience begin using fasting as a weight-loss method?

Speaker Notes

25 / 29

MEASUREMENT

Note on Measurement

- Sometimes the best weight during a day was recorded rather than a fixed time.
- Spreadsheet data entry can contain human error.
- A simple measurement/control system might allow food quality and quantity to be adjusted.
- Future work could consider sugar, fat and glycogen stores.

Measurement is critical to the process.

Speaker Notes

26 / 29

CLOSING REFLECTION

A Defined Period of Observation

- Meaningful weight change can occur without following a particular restricted-food diet.
- Fasting can produce weight loss without focusing on food quality and quantity during eating periods.
- Measurement created greater awareness of food choices.
- Long-term management may depend more on measurement, feedback and small behavioural adjustments than finding the perfect diet.
- Fasting was useful, but not the whole story.
- The key lesson was managing weight over time realistically and sustainably.

[Speaker Notes](#)

27 / 29

FURTHER WORK

Questions for More Structured Research

- Defended/stabilised weight range — set-point.
- Fasting duration, glycogen depletion and conversion of fat to ketones.
- Low-intensity activity while fasted.
- Effects of regular measurement and feedback on behaviour.

There is more to investigate.

Speaker Notes

28 / 29

Background Reading and Influences

- Patrick Holford — Optimum Nutrition.
- Patrick Holford — The Low GL Diet Bible.
- Alan Goldhamer & Douglas Lisle — The Pleasure Trap.
- Alan Goldhamer — Can Fasting Save Your Life?

These writers influences provide background to the personal case study.
